

Ü4 LDH Solutions

The solutions are based on the contents of the LDH: <https://ldh.imise.uni-leipzig.de/>
If your own LDH instance is used for the exercise, solutions may differ — especially for Task 1.

1. Institution and Project

Search for “[Institut für Medizinische Informatik, Statistik und Epidemiologie \(IMISE\)](#)”.
Navigate to “Related Items”, where it states:

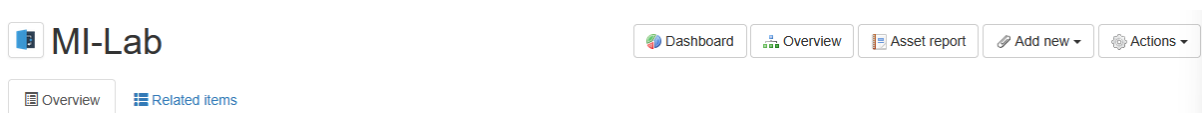

The screenshot shows the LDH interface for the 'Institut für Medizinische Informatik, Statistik und Epidemiologie (IMISE)'. At the top, there is a header with the institution's name and a small icon of a building. Below the header, there are two tabs: 'Overview' and 'Related items'. The 'Related items' tab is selected. Under the 'Related items' tab, there are two buttons: 'People (5)' and 'Projects (6)'. The 'Projects (6)' button is highlighted in blue.

Therefore, there are **6** projects within this institution.

2. Creating an Investigation

Under the project “MI-Lab”, add an Investigation:

The screenshot shows the LDH interface for the 'MI-Lab' project. At the top, there is a header with the project name 'MI-Lab'. Below the header, there are several tabs: 'Dashboard', 'Overview', 'Asset report', 'Add new', and 'Actions'. The 'Add new' tab is selected. Under the 'Add new' tab, there are two buttons: 'Overview' and 'Related items'. The 'Related items' button is highlighted in blue.

In the top-right corner, click the “Add new” button and select “Investigation”.

2.1. Extended Metadata Schema

Select “MIAPPE metadata v1.1” and complete the metadata fields.

2.2. Access Rights

Configure the access rights for this Investigation so that only people from your project can access it.

Sharing ▲

Here you can specify who can **view** the summary of and **edit** the Investigation.

	No Access	View	Edit	Manage
Public	✕	○		
MI-Lab	○	✓	✓	✓

Share with a Person Share with a Project / Institution Share with a Programme

Why are access rights necessary for clinical studies?

Not everyone on the internet should be able to view study-specific data such as datasets. However, members of the study team need full access to all relevant data.

Why should not all data from a clinical study be made openly available?

Data related to study participants is personal and sensitive information and must not simply be published openly on the internet.

3. Creating a Study

This is similar to the solution for Task 2. The only difference is that under the Investigation, you must select “Add new” → “Study”.

4. Creating an Experimental Assay

4.1. Documents

Why should these documents be uploaded in addition to the dataset?

These documents are essential for better reusability and interpretability. In addition to the data itself, they are necessary because they ensure: scientific context and understanding (study protocol), reliability (data quality rules), and comprehensibility (data dictionary).

What are these documents used for in a clinical study?

See also the lecture slides.

FDMP:

The FDMP describes how these three components are embedded overall and how data and documentation are handled throughout the entire research lifecycle.

Study Protocol:

Important for transparency and reproducibility. Other researchers can understand why and how the data was collected.

Data Quality Rules:

Describe which validation and plausibility checks are applied to the data (e.g., value ranges, missing data, duplicate records).

Data Dictionary:

Contains definitions of the variables (e.g., column name, meaning, data type, units, coding systems).

It is indispensable for any kind of data reuse or integration, because otherwise nobody knows what variables such as “HR” or “ICU_stay_id” actually mean.

It also enables interoperability, since variables can be machine-readable annotated or mapped to standards such as SNOMED CT or LOINC.
